Tidvverse

The **tidyverse** is a powerful collection of R packages that are actually data tools for transforming and visualizing data. All packages of the tidyverse share an underlying philosophy and common APIs.

The core packages are:

qqplot2, which implements the grammar of graphics. You can use it to visualize your data.

dplyr is a grammar of data manipulation. You can use it to solve the most common data manipulation challenges.

tidyr helps you to create tidy data or data where each variable is in a column, each observation is a row end each value is a cell.

readr is a fast and friendly way to read rectangular data.

purrr enhances R's functional programming (FP) toolkit by providing a complete and consistent set of tools for working with functions and

tibble is a modern re-imaginging of the data frame.

• stringr provides a cohesive set of functions designed to make working with strings as easy as posssible

• forcats provide a suite of useful tools that solve common problems with factors.

You can install the complete tidyverse with:

> install.packages("tidyverse")

Then, load the core tidyverse and make it available in your current R session by running:

> library(tidyverse)

Note: there are many other tidyverse packages with more specialised usage. They are not loaded automatically with library(tidyverse), so you'll need to load each one with its own call

Useful Functions

_		
	> tidyverse_conflicts()	Conflicts between tidyverse and other packages
	> tidyverse_deps()	List all tidyverse dependencies
	> tidyverse_logo()	Get tidyverse logo, using ASCII or unicode characters
	> tidyverse_packages()	List all tidyverse packages
	<pre>> tidyverse_update()</pre>	Update tidyverse packages

Loading in the data

library(datasets)	Load the datasets package
library(gapminder)	Load the gapminder package
attach(iris)	Attach iris data to the R search path

dplyr

Filter

filter() allows you to select a subset of rows in a data frame.

```
filter(Species=="virginica")
iris %>%
    filter (Species == "virginica",
          Sepal.Length > 6)
```

Arrange

arrange () sorts the observations in a dataset in ascending or descending order based on one of its variables.

```
> iris %>%
      arrange (Sepal.Length)
      arrange(desc(Sepal.Length))
```

Sort in ascending order of sepal length Sort in descending order of sepal length

Select iris data of species

Select iris data of species

"virginica" and sepal length

"virginica"

greater than 6.

Combine multiple dplyr verbs in a row with the pipe operator %>%:

```
iris %>%
  filter(Species=="virginica") %>% then arrange in descending
   arrange (desc (Sepal.Length))
```

Filter for species "virginica" order of sepal length

Summarize to find the

Filter for virginica then

summarize the median

Find median and max

sepal length

median sepal length

Mutate

mutate () allows you to update or create new columns of a data frame.

```
Change Sepal.Length to be
> iris %>%
                                              in millimeters
    mutate(Sepal.Length=Sepal.Length*10)
 iris %>%
                                              Create a new column
                                              called SLMm
    mutate(SLMm=Sepal.Length*10)
```

Combine the verbs filter(), arrange(), and mutate():

```
filter(Species=="Virginica") %>%
mutate(SLMm=Sepal.Length*10) %>%
arrange (desc (SLMm))
```

Summarize

> iris %>%

summarize () allows you to turn many observations into a single data point.

>	iris %>%	ŀ
	<pre>summarize(medianSL=median(Sepal.Length))</pre>	l
>	iris %>%	ı
	filter(Species=="virginica") %>%	ı
	<pre>summarize(medianSL=median(Sepal.Length))</pre>	
	>	<pre>> iris %>% filter(Species=="virginica") %>%</pre>

You can also summarize multiple variables at once:

```
filter(Species=="virginica") %>%
summarize (medianSL=median (Sepal.Length),
          maxSL=max(Sepal.Length))
```

group by () allows you to summarize within groups instead of summarizing the entire dataset:

```
sepal length of each
  group by (Species) %>%
  summarize (medianSL=median (Sepal.Length)
                                                species
             maxSL=max(Sepal.Length))
                                                Find median and max
iris %>%
                                                petal length of each
  filter(Sepal.Length>6) %>%
                                                species with sepal
  group by (Species) %>%
  summarize (medianPL=median (Petal.Length)
                                                length > 6
             maxPL=max(Petal.Length))
```

ggplot2

Scatter plot

Scatter plots allow you to compare two variables within your data. To do this with ggplot2, you use geom point()

```
> iris small <- iris %>%
    filter(Sepal.Length > 5)
                                               Compare petal
 ggplot(iris small, aes(x=Petal.Length,
                                               width and length
                          v=Petal.Width)) +
    geom point()
```

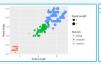

Additional Aesthetics

Color

ggplot(iris small, aes(x=Petal.Length, y=Petal.Width, color=Species)) + geom point()

Size

ggplot(iris small, aes(x=Petal.Length, v=Petal.Width, color=Species. size=Sepal.Length)) geom point()

Faceting

ggplot(iris small, aes(x=Petal.Length, y=Petal.Width)) + geom point()+ facet wrap (~Species)

Line Plots

```
by year <- gapminder %>%
  group by(year) %>%
  summarize (medianGdpPerCap=median (gdpPercap)
ggplot(by year, aes(x=year,
                     y=medianGdpPerCap))+
  geom line()+
  expand limits (y=0)
```

Bar Plots

by species <- iris %>% filter(Sepal.Length>6) %>% group by (Species) %>% summarize (medianPL=median (Petal.Length)) ggplot(by_species, aes(x=Species, y=medianPL)) + geom col()

Histograms

```
ggplot(iris small, aes(x=Petal.Length))+
 geom histogram()
```

Box Plots

ggplot(iris small, aes(x=Species, y=Sepal.Width))+ geom boxplot()
